

# Index Seminum Product Sheet

**IrisBG**  
Botanical Garden Collection Management

## Overview

*Index Seminum* is a web-based module that provides an easy way to publish the garden's seed catalogue on the internet and lets contacts or customers place seed orders directly on the web.

## Features

- This module is fully integrated with *IrisBG*, but can also be supplied as an independent solution.
- The seed catalogue and customer list are uploaded as xml-files. These can be created in *IrisBG*.
- The seed catalogue is presented in a hierarchical fashion for easy navigation and selection.
- The appearance of the user interface, information texts, the opening period, order limit, etc., can easily be configured.
- There is an option to restrict access to predefined customers only.
- A confirmation e-mail is sent to the customer when an order is completed.
- The order can be sent by e-mail to the garden or received directly in *IrisBG* through a web service.

The screenshot displays the 'Index Seminum 2010' web interface. The header includes the title and 'Demo Botanical Garden - Demo city, Demo country'. A 'Welcome' section features a seed image and text stating the catalogue is for demonstration purposes only, available from 1 December 2010 to 31 December 2015. A 'Create order from the seed catalogue' section provides instructions and buttons for 'Place order', 'Expand all', 'Collapse all', and 'Clear selected'. The tree view shows a hierarchy: 'Index Seminum 2010' > 'Part 1: Spontaneous plants, Norway' > 'Crassulaceae' > 'Fabaceae' > '2 *Oxytropis leucantha* subsp. *subarectica* 2009' (checked) and 'Poaceae' > '5 *Bartsia decurva* Hochst. ex Benth. 2010-09-08.' (checked). A 'Terms and conditions' section follows, detailing the use of seeds for research and education. The footer contains copyright information for 2010 and 2007-2013, social media links for Facebook and Twitter, and the IrisBG logo.

## Architecture and requirements

The *Index Seminum* module is built with Microsoft ASP.NET 2.0 and Ajax. Data upload and maintenance are performed through an administrator page. Supported on Microsoft Internet Information Services.
